### INTRODUCTION

The Mk 5 Mod 1 3-Inch Cartridge Tank tested, contained a simulated load of 28 pounds of sand representing the worst case of loading. Overall weight of the tank was 35 pounds. This Performance Oriented Packaging (POP) test was performed to ascertain whether this standard container (Packing Group II) would meet the requirements as specified by the United Nations Recommendation on the Transportation of Dangerous Goods Document, ST/SG/AC.10/1, Revision 6, Chapters 4 and 9. A base level vibration test was also conducted in accordance with the final rulings specified in the Department of Transportation's Performance Oriented Packaging Standards in the Federal Register Volume 55.

The objectives of these tests were to minimize the risk of personnel or environmental exposure to the hazards associated with the contents in the advent of a transportation or handling accident.

### **TESTS PERFORMED**

### 1. Base Level Vibration Test

This test was performed in accordance with paragraph 178.608 of the Performance Oriented Packaging Standards, Final Ruling, published in the Federal Register, Vol. 55, No. 246, December 21, 1990. Three sample tanks were placed on the repetitive shock platform. The tanks were restrained during vibration in all but the vertical direction. The frequency of the platform was increased until the tank left the platform 1/16 of an inch at some instant during each cycle. Test time was 1 hour at a frequency of 3.83 Hz.

### 2. Stacking Test

This test was performed in accordance with ST/SG/AC.10/1, enapter 9, paragraph 9.7.6. Three tan were used for this test. Each tank was subjected to a force applied to its top surface equivalent to the total weight of identical packages stacked to a height of 3 meters (including the test sample). A weight of 2,152 pounds was stacked on the three tanks (717.3 pounds/tank). The test was performed for 24 hours. After the allowed time, the weight was removed and the tanks examined.

### 3. Drop Test

This test was performed in accordance with ST/SG/AC.10/1, chapter 9, paragraph 9.7.3. Six tanks were used as required. The drops were performed from a height of 1.2 meters (4 feet) in the following orientations (three tanks for each orientation):

- a. Horizontally.
- b. Diagonally on the edge between the cover assembly and the top ring of the tank.

... is test was performed at an ambient temperature of  $\pm 70 \pm 20$  °F.

### PASS/FAIL (UN CRITERIA)

### 1. Base Level Vibration Test (HM-181 CRITERIA)

The criteria for passing the base level vibration test is outlined in paragraph 178.608 of the Title 49 CFR Final Ruling and states the following: "immediately following the period of vibration, each package shall be removed from the platform, turned on its side and observed for any evidence of leakage. Rupture or leakage from any of the packages constitutes failure of the test."

## 2. Stacking Test (UN CRITERIA)

The criteria for passing the drop test is outlined in paragraph 9.7.6.3 of ST/SG/AC.10/1 and states the following: "... no test sample should leak. No test sample should show any deterioration which could adversely affect transport safety or any distortion liable to reduce its strength or cause instability in stacks of packages."

### 3. Drop Test (UN CRITERIA)

The criteria for passing the drop test is outlined in paragraph 9.7.3.5 of ST/SG/AC.10/1 and states the following: "Where a packaging for solids undergoes a drop test and its upper face strikes the target, the test sample passes the test if the entire contents are retained by an inner packaging or inner receptacle; e.g., a plastic bag, even if the closure is no longer sift-proof. A slight discharge from the closure(s) upon impact should not be considered to be a failure of the packaging provided that no further leakage occurs."

### **TEST RESULTS**

## 1. Base Level Vibration Test

Satisfactory.

### 2. Stacking Test

Satisfactory.

### 3. Drop Test

Satisfactory.

### **DISCUSSION**

### 1. Base Level Vibration Test

Immediately after the vibration test was completed, each tank was removed from the platform, turned on its side and observed for any evidence of leakage. There was no leakage to the tanks as a result of this test.

### 2. Stacking Test

Each tank was visibly checked after the 24-hour period was over. There was no leakage, distortion, or deterioration to any of the tanks as a result of this test.

## 3. Drop Test

After each drop, the tanks were inspected for any damage which would be a cause for rejection. Final inspection indicated damage was minimal with only minor denting noted. The tanks remained intact and functional upon completion of the tests.
